

Flexential network services

It's all in the backbone

The Flexential fiber network is built using multiple, diverse connections from leading national providers to ensure maximum performance and reliability. Our core network is built using 10-gigabit and 100-gigabit connections. Utilization of the backbone is constantly monitored and additional bandwidth is proactively added as needed.

Flexential network services enable our customers to access our extensive carrier network by providing high-speed network access over our backbone into any of our data centers. Even if a carrier is not local to your data center, or even your metro area, you can access their services by connecting to a data center wherever that carrier is available. Flexential interconnection services can be leveraged to improve your user experience by reducing latency, gain access to cloud services or improve your business continuity strategy.

Beyond access to leading service providers, Flexential also offers dedicated interconnection services over our backbone network. We provide dedicated, fully meshed, Layer 2 connectivity between all of our data centers. This service offers fast reroute network protection which will automatically reroute traffic through redundant paths, maximizing uptime and availability of your services.

IP bandwidth features

- 95th percentile burstable bandwidth billing options
- Native IPv6-enabled core and edge networks
- Border Router technology that chooses the optimal routing path
- Bandwidth utilization reporting
- Border Gateway Protocol options
- 24/7 proactive network monitoring
- Advanced traffic engineering
- Comprehensive testing and issue isolation
- DDoS protection included
- Automated detection and scrubbing mitigation
